

Comparing Commits in Eclipse

Inspecting Git History

To inspect the Git history of a project, right click on it and select Team->Show in History:

The upper panel displays all commits in reverse chronological order, starting with the latest. The lower left panel displays information about the currently highlighted commit. The lower right panel lists all of the files modified in that commit.

Compare Mode

Click the Compare Mode toggle button in the toolbar of the History View.

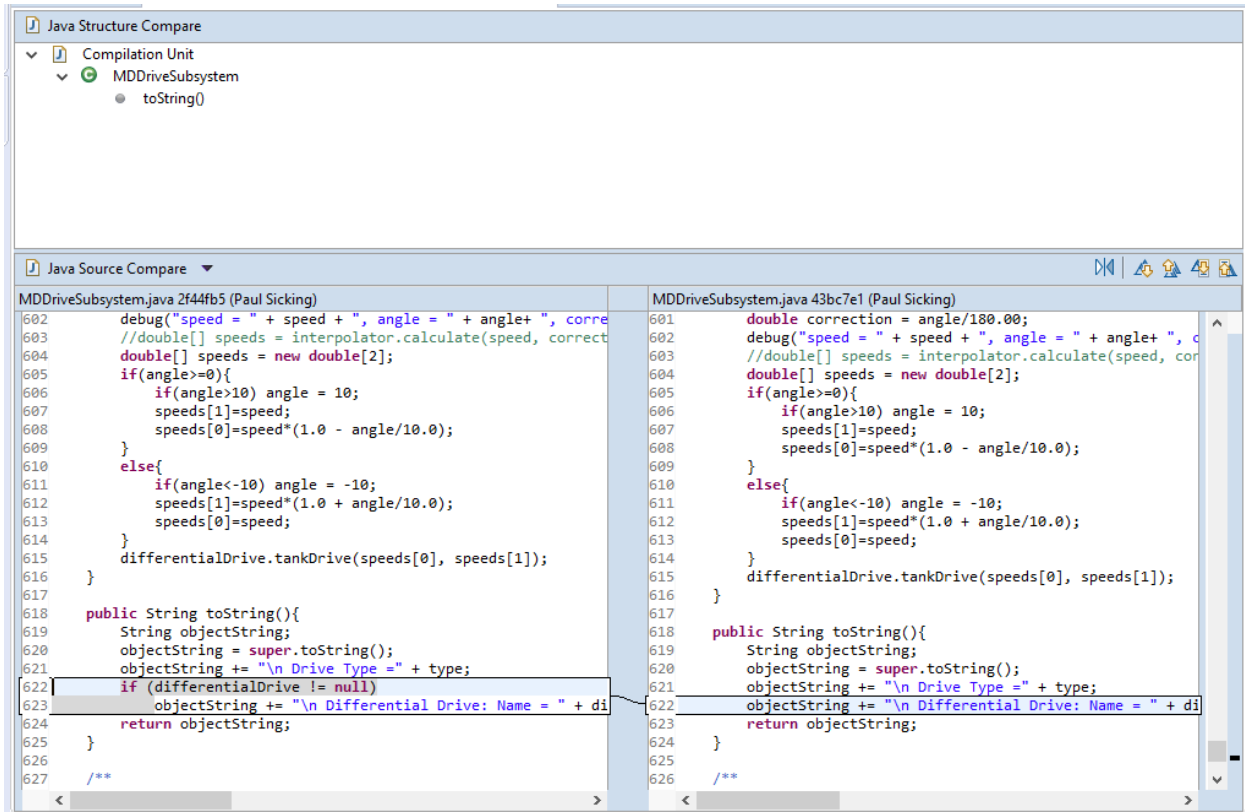

Then double click one of the files in the Resource list (lower right panel) of the History View (for example, MDriveSubsystem.java). This will display the following Java Structure Compare window, which highlights what code was modified in this commit. The change in this example is an inserted conditional statement in the toString() method.
